

Requirements Elicitation Exercise

Formative (ungraded) · groups of 3–4 · in-session · worksheet feeds your Week 2 portfolio commit

Item	Details
Linked to	Week 2 lecture — Requirements Engineering (ULO2); rehearses Task 2 skills
Time	60 minutes: 10 setup · 20 interview · 20 write-up · 10 playback
Roles	1 Client (role card from facilitator) 2 Analysts · 1 Observer
Output	Completed worksheet (Part C) — commit it to week02/ in your Git portfolio

How it works

1. Your facilitator gives the Client a role card — ONE of the two businesses below, with private details the Analysts do not see. The Client answers questions in character and volunteers nothing that is not asked.
2. Analysts interview the Client (20 min). Use the lecture's PNG practices: tok stori first, plain language, play answers back, probe for constraints (power, network, cash handling, who else decides).
3. The Observer ticks the observation checklist (Part B) and gives feedback at the end.
4. Together, write up requirements (Part C). Then read them BACK to the client — validation — and mark any the client corrects.

The two businesses

Case A — Kina Ridge Primary School, Port Moresby

A private primary school (450 students) tracking term fees in an exercise book and Excel. Parents pay cash at the office, by bank deposit, or by mobile money; many pay in instalments. The bursar wants "a proper system". The school has one office laptop, a printer, intermittent power, and WiFi that works most days.

Case B — Waghi Valley Produce Cooperative, near Mt. Hagen

A 300-member cooperative buying coffee and vegetables from members at a roadside depot, then selling in bulk. Intake is recorded in carbon-copy books; members are paid fortnightly. The depot has no mains power (solar + generator), no fixed internet, and patchy mobile signal. The manager wants to stop losing member records and payment disputes.

Part B — Observer checklist

Behavior observed	Seen?	Notes
Opened with rapport, not the question list	Yes	Because the questions was asked randomly and not by a check list.
Asked open questions before closed ones	No	Only the opened questions were asked.
Played back answers to confirm understanding	Yes	Questions were asked multiple time to come with a

Behavior observed	Seen?	Notes
		common understanding.
Asked about power / connectivity / devices	Yes	Two of the questions were asked along that line.
Asked who ELSE has a say (stakeholders)	Yes	A question was asked who the stakeholders were.
Probed a sensitive topic respectfully (arrears, credit, cash)	Yes	They asked a question concerning how the payments was made and how it was being recorded.
Captured a business RULE (policy), not just features	No	They missed out on that part.

Part C — Requirements capture worksheet

Write shall-statements where possible. Quality beats quantity — but hit the minimums.

C1. Stakeholders (min 3)

Who, and what they need from the system

The school's bursar needs it to record fee payments, track balances and generate reports.

The parents/guardians need it to know fee balances for their child or children.

The office staff needs it to make records and update the payment balance quickly.

C2. Functional requirements (min 5, numbered FR-1...)

The system shall ...

FR-1 The system shall record student information including student ID, name, grade, and payment method.

FR-2 The system shall record fee payments made by cash, bank deposits, or by mobile money and generate a printed receipt for every payment.

FR-3 The system shall calculate and display each student's outstanding fee balance.

FR-4 The system shall allow authorized staff to search for a student and view payment records.

FR-5 The system shall support recording partial payments and instalments.

C3. Non-functional requirements (min 3, think PNG: offline, power, usability)

NFR-1 ...

NFR-1 The system shall continue to operate during temporary internet outages and synchronize data when connectivity returns.

NFR-2 The system shall save data automatically to prevent loss during power interruptions.

NFR-3 The system shall be simple enough for office staff to learn and use with minimal training.

C4. Constraints & business rules (min 2 each)

Constraints (facts of the environment) / Rules (policies to enforce)

1. The school has only one office laptop available for daily use.

2. The school has unreliable power and internet connectivity.

3. Parents may pay fees in instalments until the full-term fee is paid.

4. Only authorized office staff may modify payment records.

C5. Validation notes

What did the client correct when you played it back?

The bursar clarified that instalment payments are common and must be supported.

After the session: type Part C into week02/elicitation-notes.md in your Git portfolio and commit it. This exercise is the dress rehearsal for Task 2 — the client brief you received today describes a business just like these.
